

CTG RFE Update

Original code requirement

- 1) A new string field on ECIRequest to hold tracking tokens up to 1KB (Also available to exits)
- 2) A method for client application to set the tracking token field
- 3) A set of APIs available to CTG exits to write data to UserCorrelation of the origin data.

New code requirement

- 1) Unique APMToken is created for ECI requests and available to all monitoring exits
- 2) APMToken is passed to CICS in the UserCorrelator along with a flag to indicate its existence
- 3) A toggle is provided for client application calls to specify whether APMToken should be created and passed; client applications that originate ECI requests will not need to be recompiled
- 4) For client applications on WAS using ECI resource adapter, setting the APMToken toggle will overwrite XCT
